BOUNDS ON TRANSFER PRINCIPLES FOR ALGEBRAICALLY CLOSED AND COMPLETE DISCRETELY VALUED FIELDS
by Scott Shorey Brown

This memoir begins with a unified treatment of computationally efficient decision procedures for the additive group of rational numbers, the ordered additive group of integers, and the ordered field of real numbers. Analogous procedures are developed for algebraically closed fields and complete discretely valued fields when the characteristic of the field is zero or is large compared to the length of the statement whose truth is to be determined. Bounds for the size of p required to apply the classical transfer principles between algebraically closed fields of characteristics 0 and p or between complete discretely valued fields of characteristics 0 and p follow and yield a bound for the exceptional primes in the Artin Conjecture. Finally, we derive a bound on the characteristic of the base field of a complete discretely valued field which ensures that a power series in one variable over the valued field which represents an algebraic function will converge up to the nearest singularity of the algebraic function.
